

What's New in this Version

This topic lists all the additions and improvements incorporated in in Server Configuration Manager 2021.1 that were not available in previous versions.

Version numbering

To keep in line with other Innovyze products, the version numbering has changed. This version is now 2021.1; it would have been 11.5 under the previous version numbering system.

Thales licences

You can now select a Thales type of licence to be used by your server. To configure this type of licence, simply select the [Licence](#) page, choose the **Thales** option from the **InfoWorks ICM Licence** field and specify the name or IP address of the network licence server in the **Computer name or IP address** field.

Workgroup master database groups

Workgroup master databases can now be assigned to groups. When creating or opening a workgroup master database, the **New...** button on the [Open Master Database](#) dialog now displays a [New Master Database](#) dialog that enables you to:

- select or create a new group which the master databases can belong to
- specify the name for a new database

A new **Group** field has also been added to the [Open Master Database](#) dialog from which you can select a particular group from a list of groups already defined. If you select a group, then the entries in the dropdown list in the **Database** field will be restricted to the names of the master databases assigned to the selected group.

Note that workgroup master databases require that the Workgroup Data Server software is installed and running as a service on the machine hosting the database.
