

What's New in this Version

This topic lists all the additions and improvements incorporated in Server Configuration Manager 2023.1 that were not available in previous versions.

Version selection for master databases

Each major release of Server Configuration Manager includes a new version of the master database. Previously, when you created a new master database, it would automatically be created using the latest database version. For example, a master database created using version 2023.0 of the software will have a database version of 2023.0. However, you can now choose which version of the master database is to be used when you create a new master database.

In order to choose a database version, a new Database version dropdown, has been added to the [New master database](#) dialog.

As support for different database versions is only available for database versions 2023.0 and above, the oldest version you can select is 2023.0.
